

Cyber Threat Analytics Dashboard

Transforming Fragmented Incident Data
into Predictive Operational Intelligence

Executive Briefing & Architecture Overview

The Analytical Lens

The Siloed Reality

850 raw records spanning across independent systems.

The Unified Vision

Moving from distributed, unstandardized operational logs to a single centralized intelligence engine capable of identifying emerging threats and optimizing resource allocation.

Data Foundation & Architecture

Standardizes 8 distinct reporting sources into a single source of truth, enabling cross-filtering across 90 days of activity.

Baseline Operational KPIs

Total Incidents

850

SLA Compliance

89.76%

Avg Response Time

10.39 min

Baseline Threat Severity Index (TSI)

53.4

(Medium band)

Critical Incidents

67

Open Incident Backlog

316 / 37.2%

Takeaway: The organization is handling a high volume of incidents with strong overall SLA compliance, but the 37.2% open backlog and 67 critical incidents represent immediate operational friction.

Interactive User Experience

Drill-Through

Navigates from a macro regional view directly into the City Details Page for specific incident logs and response metrics.

Custom Tooltips

Reveals deep contextual data (asset criticality, precise weather conditions) on hover without cluttering the main analytical view.

Cross-Filtering

Updates Severity Metrics

Updates Geospatial Maps

Updates Temporal Trends

Geospatial Intelligence & Risk

Incident Volume

Threat Severity

Core Insight: Risk is driven by severity, not just volume. Despite lower raw incident counts, Cincinnati and Savannah carry the highest composite risk scores due to highly elevated average severities.

Temporal & Behavioral Analytics: Anatomy of an Incident

Conclusion: Triage protocols function properly (severity dictates response effort), but the staffing model is heavily misaligned with the after-hours threat reality.

Security Risk Assessment (TSI & Vulnerability)

Regional Risk Scorecard

Overall Security Risk Score: 81.36

Region	Score	
Northern District	81.63	Critical band
Eastern Corridor	81.52	Critical band
Central Hub	79.45	
Southern Reach	77.80	
Western Sector	76.91	

Asset Vulnerability Baseline

Key Insight: Vulnerability is an organization-wide, systemic issue tightly clustered across all 8 asset types. Mitigation requires systemic policy changes rather than isolated spot-fixes.

Diagnostic: Resource Allocation Gap

Takeaway: Resource allocation is measurably uneven. Operational efficiency requires immediate resource redistribution across these specific city pairs.

Predictive Intelligence & Forecasting

Predictive Funnel

Key Insight: The confidence band explicitly widens toward the end of the 14-day window. Executive planning decisions must weight the near-term forecasted days more heavily than the outer bounds of the projection.

Emerging Risk Zones & Influencers

Convergence Note: Physical incidents are independently flagged by both the Key Influencers tool and the Security Weakness module (Max Score: 100.00), creating a highly validated signal for intervention.

Key Insights Synthesis

Risk Defies Volume

Incident volume concentrates geographically in Ohio and Georgia, but composite risk is driven entirely by severity in Cincinnati and Savannah. A volume-only staffing model fails.

Predictable Responses, Shifting Threats

Average response time is remarkably uniform (10.0–10.8 mins) regardless of geography, scaling efficiently with severity. However, threats are shifting: Environmental incidents grew 8.1% in the second half of the period.

The Silent Backlog

37.2% of all incidents (316 total) remain open. This is not a throughput failure (SLA compliance remains high at 89.76%), but an investigation and escalation bottleneck requiring distinct management.

Strategic Recommendations

Immediate Tactical Rebalance

Shift response resources from Columbus and Pittsburgh to Atlanta and Philadelphia based on identified gap scores. Rebalance daily shift schedules to cover the after-hours threat dominance.

Targeted Threat Mitigation

Prioritize physical security interventions specifically within the Critical-band Northern District and Eastern Corridor regions.

New Operational KPIs

Track the 316-incident open backlog as a standing operational metric. Revise the city-level risk banding logic to force analytical differentiation (currently 10 out of 10 cities read as "High Risk", diluting utility).

From Fragmented Data to Strategic Foresight

The initiative successfully transformed four unstandardized, siloed data feeds into an executive-ready, predictive analytical framework achieving a validated 2.71 MAE accuracy.

Leadership now possesses the capability to proactively allocate resources based on forecasted severity, rather than reacting retrospectively to raw incident volume.
